25% 被检测为由 AI 生成

该百分比表示可能是由 AI 生成的文本以及可能是由 AI 生成且经过 AI 改写的文本的总量。

注意 需进行审核。

在对学生作业做出评判之前 了解 AI 检测的局限性至关重要。我们鼓励您在使用该工具之前 先详细了解 Turnitin 的 AI 检测功能。

检测分组

 **3 纯 AI 生成文本 25%**
可能来自大型语言模型的 AI 生成文本。

 **0 经 AI 改写的 AI 生成文本 0%**
可能是使用 AI 改写工具或词语微调器修订过的 AI 生成文本。

免责声明

我们的 AI 写作评估旨在帮助教育工作者识别可能由生成式 AI 工具准备的文本。我们的 AI 写作评估可能并不总是准确的（即我们的 AI 模型可能会产生误报），因此它不应被用作对学生采取惩罚措施的唯一依据。需要进一步审查和人工判断 并结合组织的具体学术政策应用 来确定是否存在学术不端行为。

常见问题解答

我该如何解读 Turnitin 的 AI 写作百分比和误报情况

AI 写作报告中所显示的百分比 是指提交内容的符合条件的文本中 经 Turnitin 的 AI 写作检测模型判定 可能是由大型语言模型生成的文本 或可能是使用 AI 改写工具或词语微调器修改过的 AI 生成文本的比例。

在 AI 模型中 可能会出现误报（即将人类撰写的文本错误地标记为 AI 生成的文本）的情况。

AI 检测分数低于 20% 时（不会在新报告中显示这些分数） 出现误报的可能性更高。为降低错误解读的可能性 报告中不会标注分数或高亮显示相关文本 而是用星号表示 (*%)。

AI 写作百分比不应作为判定是否存在不当行为的唯一依据。审阅者/教师应将该百分比作为与学生展开建设性对话的契机 和/或根据学校政策 用它来审查提交的作业。

“符合条件的文本”是什么意思

我们的模型仅处理长篇写作形式的符合条件的文本。长篇写作是指构成一篇较长书面作品（如论文、学位论文或文章等）的段落中所包含的单个句子。在提交的内容中 被判定为可能是 AI 生成的符合条件的文本将以青色高亮显示 可能是 AI 生成后又被 AI 改写的文本将以紫色高亮显示。

不符合条件的文本 如项目符号列表、注释性参考文献目录等 将不会被处理 这可能会导致提交内容中的高亮显示部分与所显示的百分比之间存在差异。

Personal Statement

The first time I moved a Lego robot with code, I was deeply attracted by programming. As I learned to program the robot's routes and actions, I felt excited about translating ideas into real actions via code. The sense of achievement was overwhelming when I completed a project on robot Mars resource exploitation under my teacher's guidance. As my programming skills improved, so did my passion. Driven by this passion, I started learning computer languages. I loved analyzing the logical principles behind them and enjoyed dynamic programming. Till now, I have mastered C++ proficiently and also expanded to Python. To sharpen my skills, I participated in various projects and competitions, which also deepened my understanding of the computer field.

During the winter holiday of 2021, I participated in the 39th Changsha Youth Science and Technology Innovation Competition and won the 1st prize. Guided by my teacher, I independently developed a mini program for optimal urban road path planning using C++. Choosing the most suitable path planning algorithm was not easy. I compared the path planning algorithms, including SPFA, Dijkstra, and Floyd, and found that Dijkstra is the most efficient when dealing with non-negatively weighted graphs. Since my project didn't need to handle negative-weight graphs, I ultimately chose the Dijkstra algorithm. Selecting the factors that most affect the commuting time was another challenging since there were many possible factors, including the real-time congestion level of the road, the distance between origin and destination, the number and duration of traffic lights, the situation of road restrictions, etc. Following the teacher's reminder, I decided to base my judgment on real data. I selected three fixed routes and conducted multiple on-site observations and data records, which was effective. The factors I chose proved to be the best dimensions for optimal path planning and recommendation. This project not only honed my programming skills but also exposed me to the complete development process from problem analysis, research, to functional implementation. I thus became more eager to participate in more complicated projects in the future.

Then, in the summer holiday of 2022, I was involved in the National Olympiad in Informatics for Teenagers (NOIP). After a short preparation period, I achieved first place in the Certified Software Professional Juniors. I also won second place in the Certified Software Professional Senior that involves more complex data structures, algorithms, and programming. These achievements acknowledged my algorithmic thinking and programming skills, and also inspired me to explore this field deeper. Following that, I attended the 40th National Youth Informatics Olympiad Winter Camp during the winter holiday of 2023, aiming to access more advanced computer knowledge. There, I systematically studied fifteen courses, including Theorem Proving and Program Verification, Application of Network Flow in Optimization Problems, Dynamic Programming Algorithms and Applications, Tree Data Structures, Computational Geometry, etc. Through these trainings, I mastered core algorithms such as dynamic programming and blocking, as well as data structures like trees and graphs. My abilities in model construction, abstract thinking and logical analysis were also enhanced. After class, I took advantage of discussions and programming practices to connect theory with applications. In the closing exam, I won the bronze award. This camp allowed me to communicate and work with programming enthusiasts from all over the country, greatly improving my teamwork and communication skills. More importantly, through exploring more complicated areas of the computer area, I realized that there are still many unknowns waiting for

me to explore. I thus became more determined to study computer at university.

The Department of Computer Science and Engineering Admission Scheme of the Hong Kong University of Science and Technology is my top choice. After a one-year study in the Department, I plan to choose the BEng in Computer Science program. This program perfectly aligns with my academic expectations. The core courses covering programming, data structures and algorithms, operating systems, and software engineering will solidify my fundamental knowledge and skills in computer science. A wide range of elective courses will provide me with opportunities to explore cutting-edge fields such as artificial intelligence and machine learning. Moreover, it offers undergraduate research opportunities for elite students and an optional one-year full-time internship. This will not only enhance my professional capabilities but also enable me to discover the directions that truly interest me in practice. After graduation, I plan to pursue further studies in this specific field. In the future, I hope to devote myself to the construction of the digital universe.

I am confident that I have well prepared for my future studies. So far, I have mastered the necessary computer knowledge and developed essential programming skills. I also self-studied the basics of machine learning through online courses on Coursera and initially understood deep learning frameworks and their applications. All these have laid a solid foundation for my forthcoming studies in computer science. Meanwhile, in high school, I always excelled in the mathematics course and also expanded to advanced mathematics knowledge such as data structures, discrete mathematics, linear algebra, number theory, probability and statistics. This will give me an edge in tackling algorithm design and analysis. In addition, I possess both artistic and sports talents. I am quite skilled in badminton. In my spare time, I have been learning to play the drums and bass. I am also capable of arranging and have produced a personal album. I believe that this diverse background will not only enable me to constantly break through in my academic pursuits but also bring more vitality and diversity to campus life.
