28% 被检测为由 AI 生成

该百分比表示可能是由 AI 生成的文本以及可能是由 AI 生成且经过 AI 改写的文本的总量。

注意 需进行审核。

在对学生作业做出评判之前 了解 AI 检测的局限性至关重要。我们鼓励您在使用该工具之前 先详细了解 Turnitin 的 AI 检测功能。

检测分组

 **1 纯 AI 生成文本 28%**
可能来自大型语言模型的 AI 生成文本。

 **0 经 AI 改写的 AI 生成文本 0%**
可能是使用 AI 改写工具或词语微调器修订过的 AI 生成文本。

免责声明

我们的 AI 写作评估旨在帮助教育工作者识别可能由生成式 AI 工具准备的文本。我们的 AI 写作评估可能并不总是准确的（即我们的 AI 模型可能会产生误报），因此它不应被用作对学生采取惩罚措施的唯一依据。需要进一步审查和人工判断 并结合组织的具体学术政策应用 来确定是否存在学术不端行为。

常见问题解答

我该如何解读 Turnitin 的 AI 写作百分比和误报情况

AI 写作报告中所显示的百分比 是指提交内容的符合条件的文本中 经 Turnitin 的 AI 写作检测模型判定 可能是由大型语言模型生成的文本 或可能是使用 AI 改写工具或词语微调器修改过的 AI 生成文本的比例。

在 AI 模型中 可能会出现误报（即将人类撰写的文本错误地标记为 AI 生成的文本）的情况。

AI 检测分数低于 20% 时（不会在新报告中显示这些分数） 出现误报的可能性更高。为降低错误解读的可能性 报告中不会标注分数或高亮显示相关文本 而是用星号表示 (*%)。

AI 写作百分比不应作为判定是否存在不当行为的唯一依据。审阅者/教师应将该百分比作为与学生展开建设性对话的契机 和/或根据学校政策 用它来审查提交的作业。

“符合条件的文本”是什么意思

我们的模型仅处理长篇写作形式的符合条件的文本。长篇写作是指构成一篇较长书面作品（如论文、学位论文或文章等）的段落中所包含的单个句子。在提交的内容中 被判定为可能是 AI 生成的符合条件的文本将以青色高亮显示 可能是 AI 生成后又被 AI 改写的文本将以紫色高亮显示。

不符合条件的文本 如项目符号列表、注释性参考文献目录等 将不会被处理 这可能会导致提交内容中的高亮显示部分与所显示的百分比之间存在差异。

Personal Statement

My enthusiasm for artificial intelligence originated from my elder brother. As he studied software engineering for both his undergraduate and master's degrees, he often shared with me how intelligent code assistants debugged programs and how knowledge graphs organized project materials. I was attracted by its efficiency of learning and working, which compressed the time spent on complex and time-consuming tasks to some degree. This experience sparked my strong interest in artificial intelligence. Along with my exploration of artificial intelligence, I strengthened my determination to pursue a bachelor's degree in this domain.

My endeavors in high school laid the foundation for my undergraduate studies. For instance, I learned statistics and function graphs in mathematics. It developed my analytical skills and rigorous logical thinking. Physics courses further honed my logical thinking ability. My proficiency in English allowed me to read some foreign language materials smoothly and helped me stay updated on the latest information at the first time, which would facilitate communication and cooperation with others in different environments. Biology cultivated my cautious experimental awareness, including controlling variables during experiments or dissecting results. I believe that the accumulation of these courses and theoretical knowledge will provide varying degrees of assistance in my future study of the artificial intelligence major.

My leadership and teamwork skills were greatly enhanced when I served as the vice minister of the Organization Department of the student union at my high school. During this period, I participated in organizing my school's anniversary celebration, sports meeting, various performances, and club activities. One of the most memorable experiences was when I was fully involved in the overall planning of the anniversary activities. I coordinated teachers to participate in the review and synchronized the adjustment opinions of the programs, as well as communicated with the logistics department to complete the equipment trial performance to identify potential faults. During the campus open day, I planned the visiting routes for the four functional areas including the school history exhibition area and the club experience area, and coordinated the division of 80 volunteers into six groups based on program coordination, venue guidance, and equipment assistance. We successfully received over 500 visitors. These experiences accumulated my practical ability to organize my teamwork skills and greatly developed my leadership skills.

In the summer vacation of 2024, I was lucky enough to participate in the offline lab of the International Genetically Engineered Machine Competition. Our team was divided into the dry team and the wet team. At that time, I needed to independently use the PCR amplification instrument. Initially, I was not familiar with the matching of GC content and annealing temperature, which led to the final amplification product having a blurry band and being an invalid product. Terribly, there was a large amount of experimental data to be processed that day. Facing these difficulties, I immediately decided to

communicate with my dry team teammates and asked them to record the PCR temperature and the environment of E. coli while I was conducting the experiment. Then I sought help from my teacher to sort out mistakes in my experiment. In the evening, I again optimized the table by organizing all the types of substrates and the experimental data of all the instruments we used into one table. As I also served as a photographer, when I recorded the experimental process of all teammates and handed it over to the dry team teammates to make promotional videos, I found out some small mistakes during the experiment and finally summarized them into a table, making our parameter lookup and experimental report more efficient in the later stage. I eventually obtained the target product and wrote two sub-reports. Finally, our smooth manuscript, solid experimental foundation, and fluent Q&A ultimately won the gold medal. This experience made me realize the value of cross-role cooperation, exercised my team communication skills and division of labor adaptation ability, and also cultivated the habit of arranging my schedule in an orderly manner in a tight schedule and my ability to independently solve problems in unexpected situations.

Afterwards, I participated in the HKU Business School Global Leader programme-Science and Technology. During this period, I studied biomedicine and bioengineering, and took part in public welfare activities. I visited several top universities in Hong Kong. It was this journey that I decided to study in Hong Kong, especially at The University of Hong Kong. I am attracted by its international atmosphere, inclusive culture, and top-quality education. I particularly want to study the Bachelor of Arts and Sciences in Applied Artificial Intelligence program. This program will allow me to apply interdisciplinary knowledge to a broad spectrum of integrated applications and technological innovations. I hope to systematically learn the technical logic of AI in the courses and laboratories at HKU, and to develop more intelligent auxiliary tools that are suitable for scientific research and learning scenarios. As for my career goal, I aspire to join enterprises or research institutions related to artificial intelligence, develop some AI-assisted tools, and deepen the logic of cross-disciplinary application of AI.
