47% 被检测为由 AI 生成

该百分比表示可能是由 AI 生成的文本以及可能是由 AI 生成且经过 AI 改写的文本的总量。

注意 需进行审核。

在对学生作业做出评判之前 了解 AI 检测的局限性至关重要。我们鼓励您在使用该工具之前 先详细了解 Turnitin 的 AI 检测功能。

检测分组

2 纯 AI 生成文本 47%

可能来自大型语言模型的 AI 生成文本。

0 经 AI 改写的 AI 生成文本 0%

可能是使用 AI 改写工具或词语微调器修订过的 AI 生成文本。

免责声明

我们的 AI 写作评估旨在帮助教育工作者识别可能由生成式 AI 工具准备的文本。我们的 AI 写作评估可能并不总是准确的（即我们的 AI 模型可能会产生误报），因此它不应被用作对学生采取惩罚措施的唯一依据。需要进一步审查和人工判断 并结合组织的具体学术政策应用 来确定是否存在学术不端行为。

常见问题解答

我该如何解读 Turnitin 的 AI 写作百分比和误报情况

AI 写作报告中所显示的百分比 是指提交内容的符合条件的文本中 经 Turnitin 的 AI 写作检测模型判定 可能是由大型语言模型生成的文本 或可能是使用 AI 改写工具或词语微调器修改过的 AI 生成文本的比例。

在 AI 模型中 可能会出现误报（即将人类撰写的文本错误地标记为 AI 生成的文本）的情况。

AI 检测分数低于 20% 时（不会在新报告中显示这些分数） 出现误报的可能性更高。为降低错误解读的可能性 报告中不会标注分数或高亮显示相关文本 而是用星号表示 (*%)。

AI 写作百分比不应作为判定是否存在不当行为的唯一依据。审阅者/教师应将该百分比作为与学生展开建设性对话的契机 和/或根据学校政策 用它来审查提交的作业。

“符合条件的文本”是什么意思

我们的模型仅处理长篇写作形式的符合条件的文本。长篇写作是指构成一篇较长书面作品（如论文、学位论文或文章等）的段落中所包含的单个句子。在提交的内容中 被判定为可能是 AI 生成的符合条件的文本将以青色高亮显示 可能是 AI 生成后又被 AI 改写的文本将以紫色高亮显示。

不符合条件的文本 如项目符号列表、注释性参考文献目录等 将不会被处理 这可能会导致提交内容中的高亮显示部分与所显示的百分比之间存在差异。

Personal Statement

The decision to apply for a master's degree in computer science stems from my keen interest and its promising career prospects. While transferring majors, I taught myself C++ and designed a "transfer major system". Despite its crude interface, seeing the functional system on my screen gave me a sense of satisfaction in manipulating codes into workable software. This not only revealed my passion and aptitude in computer science but also paved the way for my successful major shift. After thorough consideration and inquiries, I chose to specialize in Data Science and Big Data Technology and have already achieved notable accomplishments. I am confident I will further refine my professional skills and innovative capabilities, striving for even greater achievements.

My exploration at Tongji University has been enriching. In addition to establishing a solid foundation in computer theory, I have acquired proficiency in several techniques (Django, database), as well as models (Transformer, Diffusion Model). These have prepared me for future academic pursuits and practical applications. In particular, advanced AI-related courses like *Neural Networks and Deep Learning*, and *Data Mining* have significantly piqued my research interest in this field and solidified my resolve to explore further deep learning (DL). For example, the *Data Mining* course, where the instructor specialized in utilizing machine learning for medical image segmentation (tumour identification), sparked my interest in computer vision (CV). These courses encompass the latest AI techniques, especially the diverse domain models grounded in neural networks. Consequently, after settling on pursuing a graduate program, I desire to apply for an ideal major that aligns with my current knowledge accumulation.

In the spring of 2023, I embarked on a four-month exchange program at the Department of Computer Science and Information Engineering, National Taiwan University (NTU). During this period, I successfully tackled the challenges posed by various projects, e.g. the Large Language Model (LLM) Application Large Project in *Natural Language Processing*: classification of legal provisions for illegal advertisements in government announcements and detection of illegal parts of advertisements and provision of legal basis. What is worth mentioning is that in Mr. Hung-yi Lee's *Machine Learning* course covering 15 sub-areas within the field, I specifically concentrated on the breakthrough highlight for the generative model in the CV, namely DDPM (Denoising Diffusion Probabilistic Models) and its application scenarios. The two instances above have equipped me with the academic ability to research model principles in DL and the adaptability to learn the latest advancements in emerging fields.

Besides, my research talent has been enhanced by my two-year experience in the CV domain. A particularly memorable highlight was my involvement in Prof. Ye Chen's Lab, where I participated in the project titled "Towards Automated Chinese Ancient Character Restoration: a Diffusion-based Method with a New Dataset". Initially, I played a supportive role in brainstorming innovative ideas for the project. As my understanding deepened, I transitioned to a leading position, diving deeper into the project. Apart from paper writing, I also mastered the architecture and functionality of the neural network model in the experiment and incorporated special operators into the model to achieve the desired outcomes. Eventually, our paper was accepted by AAI2024 and two patents derived from our research are currently under review. Throughout the process, reading cutting-edge papers has been a source of inspiration for me. For instance, the concept of the Latent Diffusion Model (LDM) sparked an idea to improve our existing published paper. By shifting the focus from adding noise directly to the image to adding noise in the hidden layers and incorporating more attention mechanisms, I believe we could enhance the restoration results. Thus, this research has made me more persistent in what I do and never give up until I reach my goals.

As a teaching assistant for the *Network Data Risk Control Technology* course, I also gained invaluable practical experience. I developed assignments rooted in financial topics and source materials including Vintage Analysis in Credit Risk Management, Credit Scorecard Development, Relationship Network Construction, etc. Furthermore, I was responsible for scheduling and testing large projects for the midterm and final, such as Risk Control Modeling and Tuning for Internet Lending Platforms, and grading them at the end. These jobs contributed to my professional knowledge, organizational skills and patience. Most importantly, I appreciated the intricacies and challenges of financial risk control in data science, and better understood how to communicate with students. The experience will serve as a valuable asset in my future education, demonstrating that I can swiftly adapt to new learning environments.

Subsequently, I immersed myself in the practical working environment. In July 2024, I interned as a test development engineer at the Private Cloud Product Quality Group, BAIDU. Stepping into the office for the first time, I encountered a brand-new challenge: the intricate underlying logic of cloud services. Guided by senior members, I rapidly acquired proficiency in functional testing techniques. Within a week of honing my software engineering skills, I learned to use the Linux central control platform to access the backend to view the underlying logic behind front-end operations and completed manual functional testing in two projects: 3212 Haiguang and Haiyang Intelligent Computing. Additionally, I gained insights into performance testing. Addressing several issues including mismatched toolkit versions, I collaborated with other project team members to complete the test and summarize the detailed test report with the reminder of my mentor. This internship provided me with a comprehensive grasp of the fundamental principles of cloud computing, making me better for future endeavors in this domain.

At the graduate level, I am committed to mastering cutting-edge knowledge in DL, particularly in areas such as CV and LLM, and applying this expertise to real-world scenarios. In the meantime, I will seize every opportunity to gain a deeper understanding of DL, focusing on enhancing my research and engineering capabilities. Upon graduation, I expect to work at a leading IT company to fully leverage my strengths and realize my value.
