27% 被检测为由 AI 生成

该百分比表示可能是由 AI 生成的文本以及可能是由 AI 生成且经过 AI 改写的文本的总量。

注意 需进行审核。

在对学生作业做出评判之前 了解 AI 检测的局限性至关重要。我们鼓励您在使用该工具之前 先详细了解 Turnitin 的 AI 检测功能。

检测分组

 **2 纯 AI 生成文本 27%**
可能来自大型语言模型的 AI 生成文本。

 **0 经 AI 改写的 AI 生成文本 0%**
可能是使用 AI 改写工具或词语微调器修订过的 AI 生成文本。

免责声明

我们的 AI 写作评估旨在帮助教育工作者识别可能由生成式 AI 工具准备的文本。我们的 AI 写作评估可能并不总是准确的（即我们的 AI 模型可能会产生误报），因此它不应被用作对学生采取惩罚措施的唯一依据。需要进一步审查和人工判断 并结合组织的具体学术政策应用 来确定是否存在学术不端行为。

常见问题解答

我该如何解读 Turnitin 的 AI 写作百分比和误报情况

AI 写作报告中所显示的百分比 是指提交内容的符合条件的文本中 经 Turnitin 的 AI 写作检测模型判定 可能是由大型语言模型生成的文本 或可能是使用 AI 改写工具或词语微调器修改过的 AI 生成文本的比例。

在 AI 模型中 可能会出现误报（即将人类撰写的文本错误地标记为 AI 生成的文本）的情况。

AI 检测分数低于 20% 时（不会在新报告中显示这些分数） 出现误报的可能性更高。为降低错误解读的可能性 报告中不会标注分数或高亮显示相关文本 而是用星号表示 (*%)。

AI 写作百分比不应作为判定是否存在不当行为的唯一依据。审阅者/教师应将该百分比作为与学生展开建设性对话的契机 和/或根据学校政策 用它来审查提交的作业。

“符合条件的文本”是什么意思

我们的模型仅处理长篇写作形式的符合条件的文本。长篇写作是指构成一篇较长书面作品（如论文、学位论文或文章等）的段落中所包含的单个句子。在提交的内容中 被判定为可能是 AI 生成的符合条件的文本将以青色高亮显示 可能是 AI 生成后又被 AI 改写的文本将以紫色高亮显示。

不符合条件的文本 如项目符号列表、注释性参考文献目录等 将不会被处理 这可能会导致提交内容中的高亮显示部分与所显示的百分比之间存在差异。

Personal Statement

Fascinated by the power of technology as a child, I recall delighting in the process of disassembling and reassembling various electronic devices in an effort to understand their functions and underlying operating principles. As I matured, I found that my interest lay especially in computers, which led to my decision to study Computer Science as my undergraduate major. During college, I mastered fundamental knowledge in computer science and utility of programming languages to solve complex problems and optimise system performance. Over the course of these studies, I nurtured an interest in embedded systems, which I came to appreciate can provide intelligent solutions for various industries and improve quality of life. Eager to build on these skills, I am enthusiastic about undertaking the master's in Computer & Embedded Systems Engineering programme.

During my time as a student in Macau University of Science and Technology, I worked hard to equip myself with a robust academic foundation which covered topics like computer science theories through courses like *Computer Organization*, *Data Structure* and *Analysis and Design of Algorithm*. Additionally, I became skilled in computer languages and tools such as C/C++, Java, Python and Matlab. What's more, the modules I took enhanced my research capability of component- system – algorithm. I also selected *Topics in Computer Science – Embedded Systems* as my optional module, which helped me to develop an understanding of embedded programming as well as the skills needed to navigate embedded equipment and write embedded programs with C language and assembly language. As such, my undergraduate degree solidified my interest and skills in embedded systems and programming.

Acknowledging the need to supplement classroom learning with self-study, I seized practical opportunities to elevate my skills. During the course *Computer Organization*, I was tasked with designing a single-cycle processor based on RISK-V instruction set which required me to understand the working principles of a single-cycle processor and RISK-V instruction set and apply them to complete a single-cycle processor capable of handling binary instruction code streams in Logism. I was challenged by the tasks of implementing full function of single-cycle processor in a digital circuit, thereby encouraging me to consult textbooks and online resources to establish my framework. As such, I outlined five stages: fetching, decoding, executing, memorising and writing back and, to ensure smooth operation, I arranged and connected each component. As a result of this project, I exercised my logical thinking and independent problem-solving skills, and I came to appreciate how even a small mistake can trouble the processor.

I elevated my expression and coordination proficiencies through working in a team to develop an online web chatroom based on SpringBoot + Vue, imitating a real software project from initiation and development to testing. After identifying the objective as online web chatroom development, we divided tasks, with my responsibility revolving around the back-end Springboot development. I quickly noted a disparity in progress amongst the members as progress stalled. Addressing this, I organised a brainstorming session and proposed that members who completed their tasks assisted those who lagged behind. Ultimately, we successfully completed the project within the allocated time, connecting and testing the front-end and back-end, and debugging the final version of the system to launch the chatroom officially, and implementing all functions. I played a key role in this success, acting as the speaker to report our findings which reflects my strengths in presenting to managers in a company.

I accumulated real-world skills by undertaking internships which exercised my software development competency and teamwork skills. As a software developer intern at Grand Science & Technology, I was involved in a project to develop polluting gas monitoring and a management system in an industry park. My responsibilities covered the setup of a database with MySQL for data storage, and design of a back-end server system with SpringBoot to implement components and provide the API for the front-end call. Owing to my lack of experience in using SpringBoot and MySQL, I consulted online resources like the *Basic Course* for MySQL Database and *Introductory Course* for SpringBoot to master relevant design and development skills. Working within the development team, I was responsible for presenting my progress well enough for the front-end developers to utilise my work, and to liaise with the department manager who I constantly reported my progress to. For a company project as large as this, I realised that sound communication skills were equally as important as technical skills. As such, I relished feedback on how I could improve by attending daily meetings to reflect on my development and keep records of my progress. My zeal for embedded systems became firm as a result of this work experience.

I have just started my graduation project since I am at the beginning of my senior year. Through this, I aim to improve Kubernetes autoscaling using deep learning by producing research that will begin by considering similar research endeavours and identifying additional metrics that can be improved upon. I will then apply deep learning techniques to develop an adaptive autoscaling policy that can dynamically adjust the number of pods based on the current workload or enhance the autoscaling on the CPU and memory of each pod. Subsequently, the proposed policy will be evaluated using a Kubernetes cluster and compared to existing autoscaling policies. I hope that the results of my work will effectively contribute to the development of more efficient and effective autoscaling policies for Kubernetes clusters.

I look forward to immersing myself in academic courses, experiments and projects during my graduate degree, especially those pertaining to embedded system design, embedded operating systems, and embedded software engineering. Moreover, I hope to engage in scientific research under the guidance of expert supervisors to explore challenging topics. To supplement my studies, I plan on attending conferences that will broaden my perspectives and enable me to publish research in academic journals. Likewise, I will seize attend academic exchanges to familiarise myself with other fields related to embedded systems, such as the Internet of Things, cloud computing, and machine learning. After graduation, I envisage working as a development engineer at a globally-renowned company like Huawei, Intel or Microsoft, where I will focus on building foundational professional skills before establishing my own company in the field of smart home and medical care, dedicated to making my users' life easier.

In light of these objectives, I consider TUD to be conducive to my future success. The Master of Computer & Embedded Systems Engineering programme perfectly aligns with my career aspirations, especially the software course, which will allow me to apply my theoretical understanding to practical training. If admitted to your programme, I am committed to conducting important research around the intelligence improvement of computers and embedded systems using AI, given how the performance of computers can be improved through deep learning and machine learning. At the same time, I acknowledge how AI can assist embedded systems in providing high-quality services. Eager to undertake higher education to elevate my creative and critical thinking, I am confident that my existing skillset and knowledge base will enable me to thrive in this programme.
